

# Activities

## Three Complete Human-AI Partnership Activities

### Overview

Each activity centers on a core principle: students discover what emerges when two fundamentally different kinds of intelligence collaborate. The activities invite students to experience firsthand how human insight and AI analysis complement each other in authentic cybersecurity contexts.

Every activity includes four grade-band versions spanning K-2 through 9-12, complete lesson plans with timing guides, student materials and worksheets, assessment rubrics, and implementation options for classrooms with limited technology access.

#### Learn More: Why Collaboration, Not Just Tools?

Research on human-AI collaboration shows that framing AI as a “tool” limits learning. When students see AI as a teammate with strengths (pattern recognition, speed) and limitations (context, judgment), they develop more sophisticated mental models. This prepares them for authentic cybersecurity work where human-AI partnerships are standard practice.

### Activity 1: Security Detective Teams

Students investigate security incidents alongside an AI partner, discovering through hands-on experience that AI excels at identifying patterns while humans excel at understanding context. Together, they solve mysteries that neither could unravel alone.

**Core Learning:** AI demonstrates strength in pattern recognition across large datasets, while humans bring irreplaceable capabilities in contextual understanding and judgment.

Grade Band	Version Name	Duration
K-2	<a href="#">Mystery Helpers</a>	20-25 min
3-5	<a href="#">Locked Library Computers</a>	30-35 min
6-8	<a href="#">Security Detective Teams</a>	45-50 min
9-12	<a href="#">Threat Investigation</a>	50-60 min

**NICE Framework Connection:** Defensive Cybersecurity, Vulnerability Analysis

## Activity 2: Ethics in Automated Security

Students develop governance policies for AI security systems, confronting the reality that AI requires thoughtful human guidance and that these decisions carry genuine difficulty. The activity reveals that designing rules for intelligent systems involves navigating competing values rather than finding clear answers.

**Core Learning:** AI governance demands careful balancing of competing priorities. There are no easy answers in this domain, only thoughtful trade-offs.

Grade Band	Version Name	Duration
K-2	<a href="#">Robot Helper Rules</a>	20-25 min
3-5	<a href="#">Computer Rules Committee</a>	35-40 min
6-8	<a href="#">Ethics in Automated Security</a>	45-55 min
9-12	<a href="#">AI Governance Workshop</a>	50-60 min

**NICE Framework Connection:** Cybersecurity Policy and Planning, Privacy Compliance, Systems Security Management

## Activity 3: AI-Assisted Incident Response

Students assume team roles during realistic security incidents, experiencing firsthand how cybersecurity professionals coordinate with AI systems when time pressure demands rapid, coordinated action.

**Core Learning:** Effective incident response emerges from diverse roles working in concert, each contributing specialized expertise that complements AI-driven analysis.

Grade Band	Version Name	Duration
K-2	<a href="#">Fix It Team!</a>	20-25 min
3-5	<a href="#">Computer Problem Solvers</a>	35-40 min
6-8	<a href="#">AI-Assisted Incident Response</a>	50-60 min
9-12	<a href="#">SOC Analyst Simulation</a>	55-60 min

**NICE Framework Connection:** Incident Response, Defensive Cybersecurity, Threat Analysis

## Suggested Sequence

While each activity stands alone, running them in sequence builds progressively sophisticated understanding of human-AI collaboration:

1. **Security Detective Teams** introduces the partnership concept
2. **Ethics in Automated Security** explores the governance implications that emerge from widespread AI deployment

### 3. AI-Assisted Incident Response applies partnership dynamics to crisis situations

#### Implementation Tips

The activities work best when educators invest time preparing and reflecting on their facilitation approach.

Experiencing the activity yourself before teaching it helps you anticipate student questions and reactions. Modeling partnership language shows students how to engage with AI as a collaborator rather than an answer machine. When AI produces errors, treat these moments as valuable teaching opportunities that illuminate what AI cannot do. Finally, focus your debrief conversations on synthesis, since the deepest learning occurs when students articulate what each partner contributed to the investigation.

See the [Implementation Guides](#) for detailed support.

#### Extension Activities

For educators seeking to deepen learning after completing the core activities, two extension modules provide additional challenges:

Extension	Focus	Best After
<a href="#">AI Failure Friday</a>	Learning from AI mistakes and critical evaluation	Any core activity
<a href="#">Executive Briefing Challenge</a>	Translating technical findings for non-technical audiences	Activity 1 or 3
